SUMMARY

Full stack developer, writing software professionally since 2018. I build and run production systems on .NET and React. My main work right now is CRMSolid, a live SaaS CRM I designed, wrote and still operate on my own: 5 deployed services, PostgreSQL, 516 automated tests, Docker and GitHub Actions on a Linux server. I am comfortable across the whole stack, from database design and query tuning to React front ends and production deployment.

TECHNICAL SKILLS

Backend: C#, .NET 8, .NET 9, ASP.NET Core, Web API, Entity Framework Core, LINQ, Python, PHP

Frontend: React, Next.js, TypeScript, JavaScript (ES6+), Tailwind CSS, Blazor, HTML5, CSS3

Databases: PostgreSQL (Npgsql, EF Core), DuckDB, Redis, MySQL. Familiar with SQL Server (MSSQL).

Desktop: Photino.NET with Blazor, Electron

Infrastructure: Docker, Docker Compose, Traefik, Let's Encrypt, GitHub Actions, Nginx, PowerDNS, Linux server administration (Hetzner)

Testing and libraries: NUnit, SignalR, Serilog, JWT and BCrypt auth, Git and GitHub

AI integration: Anthropic API, OpenAI API, Model Context Protocol (MCP) servers

Practices: OOP, SOLID, REST APIs, modular monolith design, multi-tenant SaaS, CI/CD

EXPERIENCE

Full Stack Developer - CRMSolid, SaaS CRM Platform

2025 - present

Own product. In production with paying users. I wrote the whole system myself.

- Wrote about 212,000 lines of C# and 306,000 lines of TypeScript and React across 3,770 files.
- The backend is a modular monolith, not microservices. It ships as 5 separately deployed pieces: REST API, admin panel, desktop agent, health monitor and landing site.
- PostgreSQL with EF Core: 40+ entities and 30+ API controllers. Wrote 516 NUnit test methods across 34 test files.
- Built a business directory from Overture Maps open data using DuckDB: 1.79 million records loaded into PostgreSQL. Cut the main lookup query from 277 seconds to 15 milliseconds.
- Reading the remote S3 parquet files directly did not work (2.5 GB of RAM, zero rows after 15 minutes), so I split the job into a two stage local sync and fixed the encoding and duplicate region rows that broke the bulk copy.
- Built an MCP (Model Context Protocol) server so AI assistants can read and write CRM data through defined tools and prompts. It has its own test suite.
- Built the desktop agent with Photino.NET and Blazor on .NET 9, plus an Electron build. It connects the user's machine to the cloud backend and manages 16+ communication channels.
- Added AI lead scoring using the Anthropic and OpenAI APIs. It reads incoming messages, works out intent and flags the leads worth a call.
- Built an API layer that keeps working when third party endpoints change or start rate limiting. Retries, backoff and per account request limits.
- Real time updates with SignalR, caching with Redis, structured logging with Serilog, auth with JWT and BCrypt. Multi-tenant from the first commit.
- Run the production stack myself: Docker Compose on a Hetzner server, Traefik with automatic Let's Encrypt SSL, GitHub Actions deploys over key based SSH, and a separate health monitor service that watches the other four.

Full Stack Developer - Irul Media and Lovisoft

2024 - 2025

- Built and maintained digital marketing and e-commerce sites handling around 10,000 API calls a day.
- Cut server load by about 40% on a legacy PHP and MySQL stack. Added Redis query caching and the database indexes that were missing.
- Built an automated order pipeline. Connected 5 payment and service providers over REST APIs, including Stripe and WeePay.

Freelance Full Stack Developer

2018 - 2024

- Built custom CRM and automation tools for clients across several industries.
- Wrote API wrappers, designed databases and automated manual office work using C# and Python.
- Handled 10+ client projects end to end, from the first requirements meeting to deployment.

Earlier Roles

2021 - 2022

- **Web Development Intern, Elmas İnşaat (2021 - 2022):** Maintained the corporate website, did the SEO work and improved front end load times with HTML, CSS and JavaScript.
- **Game Development Instructor, Kozmos Yazılım (2021):** Taught C# basics and object oriented programming to high school students. Supervised their 2D game projects.

SELECTED PROJECTS

NerioPanel - Multi-Tenant SaaS Platform (.NET 8, React)

2025 - 2026

- Built white label hosting so resellers can run branded panels on their own domains. One shared database, with row level security separating each tenant.
- Built a DNS layer with PowerDNS and Nginx that issues SSL certificates and routes reseller domains automatically.
- The React front end loads tenant branding (assets, CSS, config) at runtime based on the request host.

Evelynn - Multi-Session Desktop Automation Agent

2019 - 2021

- Built a multi-threaded automation core in C# using TPL and async/await. It runs 20+ sessions at once on one machine with controlled memory use.
- Added per session rate limiting and spread out request timing so the workload stays inside each service's limits instead of firing in bursts.
- Built a web dashboard for live telemetry, remote control of running instances and performance monitoring.
- Wrote a state machine that handles the decision tree, catches errors and recovers on its own without anyone watching it.

EDUCATION

Istanbul Aydin University - Associate Degree in Computer Programming

ADDITIONAL

Languages: Turkish (native), English (professional working proficiency)

Military service: Deferred until 2028

Location: Istanbul, Turkey. Open to on-site, hybrid and remote work.
